

# OhSint Machine

This is a walkthrough for the Osint Machine from TryHackMe . They just give us an image. Let's open the image, we get the image of WindowsXp. Let's run Exiftool to get more information on the image. Here is the command to install it.

[Plain Text code - 1 line - codepad](#)

[Edit descriptioncodepad.org](#)

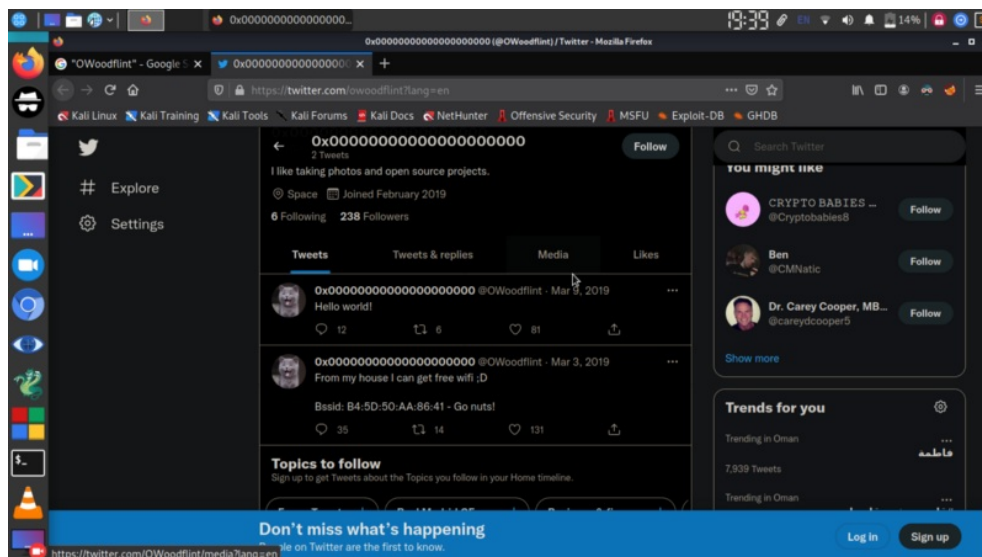

We get this information from Exiftool. From this we get the name of the image Owner, the person's name is OWoodflint.

ExifTool Scan

Let's do a quick Google Search. Search: "OWoodflint" with the quotes on Google.

We get three webpages which are useful for us. Twitter, Github and A blog Website.

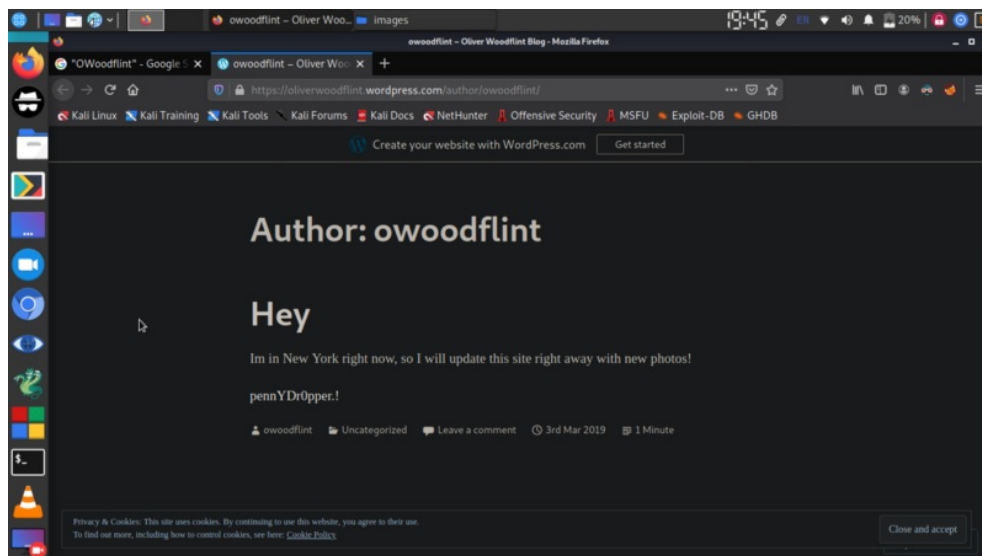

The target's twitter page

Let's open Twitter, We get the user's avatar is a picture of a **Cat**. Scroll down to the tweets of a person . We get a BSSID of the person's WIFI. Let's go to [this](#) website to find more information on the location and SSID. Login to the website[I personally suggest you to use a temporary email address].

Under 'View', you go to 'Advanced Search' and enter the BSSID from the tweet and click on search. Wait for a minute, scroll down and click on the map option next to the scan. We get the city is **London**. Next to that we also get the SSID[name of the WIFI Network].It is called **UnileverWifi**

### Owoodflint blogpage

This tells us that he is in New York, so he might be on vacation in **New York**. The line after that looks like the password, so just paste that in the TryHackMe question, we get it correct.

That's it, the room is completed. I Hope you liked this walkthrough

1 like would mean the world for me, Thank you!
